Topik 1

1. Is kind of hard to think about it to be honest because frustrating for me is all about when i see people is unheard so their voice are not delivered well to whoever people they talk to, for example if i saw people around me like my sister and my mom and they arguing about something but all are they doing is just attacking each other like not listening and then misheard, i was always like "here we go again" at that time i have to be an middle man and it piss me off because is always happens like they don't learn anything. Okay that's one, and the second is umm let me think, i'm not sure if i have another, oh! I got one, speaking English! Yeah, why? Because i actually love english like i love speaking in english but i can't, i mean i'm not that fluent like native speakers or people who have been speaking or living in english environment since they were born like i wish i had that too... and i lowkey kind of envy them somehow and i just realized about this like when i already in my 20s not earlier and it make me kind of frustated but all i can do is stop complaining and just do learn and practice like speak in english everyday, sthrength up the foundation like grammar tenses and everything but still though i'm still haven't reached that goal yet so i'm taking an english course now, not started yet because the tutor's schedule is out so i have to wait or do with other tutor, but i'm still waiting right now so i don't know if i will changed my mind tomorrow or tonight.

Topik 3

2. Okay since i have been practicing myself in python such as machine learning and artificial intelligence field so if there's anything related to this field in the company so i would like to start work in this field as an IT Programmer Officer like make a chatbot or AI agents, Beyond AI, i also have experience in software engineering both web and mobile development. This means i can contribute to different parts of a project, from the user interface to the backend logic, which makes me a flexible team member in fast-moving environments. One tool i use heavily in my workflow is Claude Code, an AI powered coding assistant that helps me speed up development significantly. By setting up specialized agents for frontend, backend, testing, and deployment, i can handle complex, production ready projects more efficiently, even when working solo. Looking further ahead, i hope to grow into a senior IT Programmer role where I can not only build systems but also help plan technical decisions and support junior developers. I believe that continuous learning, hands on experience, and genuine curiosity about new technology are what will get me there.
